Standard Specification for
Continuous Galvanizing Grade (CGG) Zinc Alloys for Hot-Dip Galvanizing of Sheet Steel

This standard is issued under the fixed designation B 852; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope*

1.1 This specification covers grades of zinc alloys, commonly known as Continuous Galvanizing Grade (CGG) alloys that contain aluminum, or aluminum and lead and that are used in continuous hot-dip galvanizing of steel sheet. The compositions for CGG grades made from primary zinc are shown in Table 1. Exceptions for grades made from secondary zinc are found in footnote C.

1.2 Other alloy compositions not included in B 852, and as may be agreed upon between the producer and the user, may be used for continuous galvanizing.

1.3 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to become familiar with all hazards including those identified in the appropriate Material Safety Data Sheet (MSDS) for this product/material as provided by the manufacturer, to establish appropriate safety and health practices, and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:
B 899 Terminology Relating to Non-ferrous Metals and Alloys
E 29 Practice for Using Significant Digits in Test Data to Determine Conformance with Specifications
E 88 Practice for Sampling Nonferrous Metals and Alloys in Cast Form for Determination of Chemical Composition
E 527 Practice for Numbering Metals and Alloys (UNS)

E 536 Test Methods for Chemical Analysis of Zinc and Zinc Alloys
E 634 Standard Practice for Sampling of Zinc and Zinc Alloys for Optical Emission Spectrometric Analysis

3. Terminology

3.1 Terms shall be defined in accordance with Terminology B 899.

4. Ordering Information

4.1 Orders for CGG alloy under this specification shall include the following information:
4.1.1 Number of ASTM standard, including year of issue,
4.1.2 Quantity (weight),
4.1.3 Name of material (CGG),
4.1.4 Size and shape (Section 7), and

4.1.5 Grade (see Table 1).

5. Materials and Manufacture

5.1 The producer shall use care that each shipment of CGG alloy be as uniform in quality as possible.

6. Chemical Composition

6.1 CGG alloy shall conform to the requirements of Table 1 as determined by chemical analysis by the producer on samples taken at his plant (see Section 9).

7. Size and Shape

7.1 CGG alloy may be ordered as either jumbos or slabs.

7.1.1 Jumbos—large castings of zinc or zinc alloy designed for handling by mechanical equipment. A jumbo usually weighs about 2400 lb (1087 kg). Jumbo shapes may vary, depending on the producer’s practice, and may be referred to as strip jumbos or as block jumbos. The nominal weight, dimensions, and location of holes or openings shall be as agreed upon between the producer and the customer.

7.1.2 Slabs—smaller castings of zinc or zinc alloy designed for manual handling, but often handled by mechanical equipment. A slab usually weighs about 55 lb (25 kg) but may weigh anywhere from 40 to 60 lb (18 to 27 kg). Slabs are usually shipped in strapped bundles weighing about 2200 lb (one metric ton). Other bundle weights may be as agreed upon between the producer and the customer.

7.1.3 Other shapes and sizes as may be agreed upon between the producer and the customer may be cast to the chemical requirements (Table 1) of this specification.

8. Appearance

8.1 CGG alloy castings (jumbos and slabs) shall be free of undue surface oxide, adhering foreign matter, and any “flash” that would interfere with handling and use.

9. Sampling for Chemical Analysis

9.1 Sampling During Casting—Samples shall be taken from the pour during the casting of CGG alloys and shall be cast as pins or discs according to Practice E 634 for spectrochemical analyses. A sample shall be taken at least every 18 metric tons (18000 kg). Unless otherwise agreed upon between the producer and the customer, chemical analyses shall be determined from these samples (see Section 6).

9.2 Sampling of Slabs—When CGG alloy slabs must be sampled, sampling shall be by drilling or sawing.

9.2.1 Selection of Portion—A portion representative of the lot shall be selected at random for the sample. From lots containing at least 60 000 lb (27 200 kg), one slab shall be taken from every 10 000 lb (4530 kg). For smaller lots, five slabs shall be taken.

9.2.2 Preparation of Sample—Each slab shall be cleaned thoroughly to rid the surface of extraneous material and drilled or sawed without lubricant in accordance with 9.2.3 or 9.2.4. Adventitious iron with which the sample may have been contaminated from the drill or the saw shall be removed with a strong magnet.

9.2.3 Drilling—Two holes shall be drilled, preferably from the bottom or brand side of each slab, at two points located along the one diagonal of the slab so that each point is halfway between the center and one extremity of the diagonal. If two holes do not yield a sample weighing at least 10½ oz (300 g), a third hole shall be drilled at the center of each slab. Each hole shall be bored completely through the slab, care being taken to avoid starting the drill in a depression, and to adjust the feed to give drillings 0.010 to 0.020 in. (0.25 to 0.51 mm) in thickness. The drill shall preferably be one twisted from flat stock. The drill diameter shall be ⅛ in. (8 mm). All the drillings shall either be cut with clean shears or broken into pieces of not over ½ in. (13 mm) in length and mixed thoroughly.

9.2.4 Sawing—Two cuts shall be made completely across and through the slab from one long side to another with a heat-treated, high-speed saw. Each cut shall be sufficient to give a total sample weight of at least 10½ oz (300 g), and all cuttings from all the slabs shall be mixed thoroughly.

9.2.5 Storage—The sample shall be split into three equal parts, each of which shall be placed in a sealed package, one for the producer, one for the customer and, if necessary, one for a referee. Tight leakproof paper sample envelopes or cardboard cartons shall be used to hold the samples.

9.3 Sampling of jumbos—Representative samples cannot be obtained from large castings (except for remelting the entire ingot in a separate furnace and then taking a sample) because of the potential for segregation. Therefore, alloy cast in the jumbo form shall be sampled from the pour.

9.4 Matters of sampling and sample preparation not covered by this specification shall be in accordance with Practice E 88.

9.5 Samples held at the producer’s plant shall be retained for not less than 90 days.

9.6 Unless otherwise provided in this section, procedures for sampling, storing, and exchange of samples shall be as agreed upon between the producer and the customer.

10. Methods of Chemical Analyses

10.1 The chemical compositions in Table 1 shall be determined by the producer, who shall use methods of analysis published in Test Methods E 536 or any spectrographic methods that may be the usual practice of the producer. In case of dispute, the referee shall use only those methods of analysis published in Test Methods E 536 unless another method has been agreed upon between the producer and the customer.

10.1.1 Samples obtained during casting (9.1) shall be analyzed individually and the average of the individual determinations for the samples from the lot shall be reported as the analysis of the lot. The average shall conform to the chemical requirements of Table 1.

10.1.2 Samples obtained by drilling or sawing shall be analyzed and reported individually for each lot. Each analysis shall conform to the chemical requirements of Table 1.

10.2 The customer may request that his samples accompany the shipment or be transmitted by other means. He may, at his discretion, analyze such samples. In the case of a dispute, the producer shall send the sample retained for referee to a referee agreed upon between the producer and the customer (see 14.1.1).
11. Rejection and Rehearing

11.1 CGG alloy supplied under this specification must satisfy the chemical requirements of Table 1. The customer may reject any material that does not conform to these requirements and, if rejected, the producer shall replace it. The full weight of the shipment shall be returned to the producer unless other provisions are agreed upon between the producer and the customer.

12. Certification

12.1 A certificate shall be provided by the producer with the following information:

12.1.1 The weight of the shipment,
12.1.2 The chemical composition of each production lot or partial lot within the shipment,
12.1.3 A statement that the material was produced, sampled and analyzed in accordance with this specification, and
12.1.4 A statement that the requirements of this specification have been met.

13. Claims

13.1 Claims shall be made in writing to the producer within thirty (30) days of receipt of material at the customer’s plant. If the claim is based on the results of the customer’s chemical analyses, those results shall be included in the claim.

13.2 When CGG alloy satisfies the chemical and physical requirements of this specification, it shall not be condemned for defects in the coating of zinc-coated products in which it was used.

14. Investigation of Claims

14.1 If a claim has been made in accord with Section 13, the producer shall respond to the customer within one week of receipt of the claim. The producer shall at that time propose either to satisfy the claim or to send his representative to the customer’s plant within one week for investigation and settlement of the claim.

14.1.1 If a claim is made that the chemical analyses requirements of Table 1 have not been met, the parties may elect to send that portion of the sample retained by the producer for referee purposes to a referee agreed upon between the producer and the customer. The determination of the referee shall be binding.

14.1.2 If a claim is made that physical defects exist, the producer’s representative shall inspect the pieces that are claimed to be defective. If after such inspection agreement cannot be reached, a referee agreed upon between the producer and the customer shall be called to examine those pieces said to be defective. The determination of the referee shall be binding.

15. Settlement of Claims

15.1 The expenses of the producer’s representative and the referee shall be paid by the loser or in proportion to concession in case of compromise.

16. Product Marking

16.1 The producer’s name or a brand name by which the producer can be identified shall be cast or stamped on each jumbo or slab.

17. Keywords

17.1 CGG alloy; Continuous Galvanizing Grade Zinc; zinc; zinc alloy; zinc metal

SUMMARY OF CHANGES

This section contains the principle changes to the standard that have been incorporated since the last issue.

(1) The title of the Specification has been changed.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.
